

ServiceNow Incident Lifecycle Automation

1. Ideation Phase

1.1 Project Title

Incident Lifecycle Automation in ServiceNow

1.2 Project Overview

The project is mainly focused on automating and standardizing the Incident Management lifecycle in ServiceNow. It helps Service Desk agents to create, classify, assign, investigate, resolve, and monitor incidents in an organized and systematic way.

The solution also combines Knowledge Management, Change Management, SLA tracking, and Child Incident Management to help resolve incidents faster and ensure that all incidents are properly tracked throughout the lifecycle.

1.3 Problem Statement

In many organizations, IT issues such as network failures, VPN problems, hardware issues, and application errors are handled through emails, calls, or informal communication. This can lead to:

- Improper incident classification.
- Delayed assignment to appropriate support teams.
- Difficulty in finding existing solutions.
- Limited visibility into incident status. **Project Planning Phase**
- Delayed escalation and resolution.
- Difficulty tracking related changes and incidents.
- Incomplete cause and resolution details.
- SLA compliance issues.

Therefore, a centralized and standardized incident management process is needed.

1.4 Proposed Idea

The proposed solution uses ServiceNow to manage the incident lifecycle through the following process:

Incident Creation → Classification → Knowledge Assistance → Assignment → Investigation → Change/Resolution → Knowledge Creation → Closure

The system supports incident creation, classification, Knowledge Article recommendations, reassignment to Level 2 teams, Emergency Change integration, Child Incident creation, resolution documentation, Knowledge Article creation, and SLA tracking.

1.5 Project Goals

1. The main goals of the project are:
2. Standardize incident creation and classification.
3. Improve incident assignment and escalation.
4. Reduce resolution time using Knowledge Management.
5. Integrate Incident and Change Management.
6. Track related issues using Child Incidents.
7. Maintain proper cause and resolution details.
8. Improve SLA monitoring and service visibility.
9. Provide a complete and traceable incident lifecycle.
